The Emergence of the New Globalization: The Approach of the Evolutionary Structural Triptych

Purpose: This study aims to analyze the emergence of a new structural configuration of globalization, with the 2008 global financial crisis serving as the first symptom of this change. By introducing the "Evolutionary Structural Triptych" (EST), this research seeks to understand the basic components of the new evolutionary trajectory of global capitalism post-2008. The study places emphasis on its interdependent and coevolving economic, political, and technological dynamic facets.

Design/methodology/approach: This research introduces the EST framework, critically contrasting it with conventional understandings in International Political Economy (IPE) to provide a comprehensive and structured analysis of global developments after 2008. It traces the phases of global capitalism since WWII, examines the central dynamic dimensions during each evolutionary phase, identifies the basic patterns, and delves into the foundational elements of the emerging era of globalization.

Findings: The analysis reveals three key findings. First, the emerging restructured globalization indicates a need for a new balance in the contemporary world system; however, this balance cannot be achieved within the architecture of the old system. Second, the new era of globalization necessitates a re-equilibrated approach across different dimensions of geopolitical stability, economic development, and innovation. This approach should emphasize sustainability, adaptability, resilience, and inclusivity, and lean towards responsible, open, and organic innovation models for a revamped global structure. Third, while many current IPE theories tend to compartmentalize aspects of the new globalization, the EST advocates for a holistic perspective that integrates politics, economics, and technology within the framework of global trends. This perspective bridges existing gaps and offers actionable insights for a dynamic and inclusive global future.

Originality: The paper presents the EST as a novel analytical instrument in the realm of the modern IPE. This tool uniquely places technology and innovation at the forefront, parallel to economic and political spheres, to comprehend the

progression of globalization. In doing so, it highlights the intertwined relationship of these structural dimensions in shaping the future of the subject of the IPE.

Keywords: New Globalization; Evolutionary Structural Triptych; International Political Economy; Evolutionary Economics; Global Responsibility; World System Phases

1. Introduction

Post World War II (postwar, hereafter), the international system experienced several transformative phases, marked by events like the 1973 and 1979 crises, the 1997 Asian financial crisis, the early 2000s dot-com bubble, the 2008 financial crisis, the COVID-19 pandemic, and the 2022 Russo-Ukrainian war. These events reshaped the International Political Economy (IPE) in terms of its actual socioeconomic landscape and as a field of academic study (Menz, 2017). Cohen (2008, p. 1) emphasizes IPE's role in understanding the nexus between economics and politics. Modern IPE usually identifies the 2008 global financial crisis as a pivotal moment, heralding a "new" or "restructured" globalization era (Baldwin, 2016; Vlados et al., 2018). This era is defined by challenges like climate change (Bradford, 2018; Zehr, 2015), the aftermath of the COVID-19 pandemic (Vlados and Chatzinikolaou, 2021a), digital divides (Calderón-Gómez et al., 2020), geopolitical tensions (Faudot and Rossiaud, 2022; Grekou et al., 2022), and migration crises (Bhabha, 2018).

Despite the growing discussions surrounding the emerging indicators of this new phase of globalization, there remains a notable scarcity of holistic analyses in the literature that comprehensively bridge its economic, political, and technological dimensions. In our view, the dynamic interplay between politics, economy, and innovation—particularly in a world transformed post-2008—demands a more cohesive

theoretical exploration from an evolutionary perspective (Nelson et al., 2018). The subsequent research questions (RQ) seek to bridge this gap:

- First RQ: Why has the new globalization seemingly started its emergence due to the 2008 global financial crisis, and how has it evolved until today?
- Second RQ: What potential developments might we expect in the future, and how would these influence the various actors in their efforts to navigate this emerging era sustainably?
- Third RQ: Within the realm of IPE, what are the main theoretical approaches to the new globalization and what are their conclusions?

Under the analytical lens of the "Evolutionary Structural Triptych" (EST), a framework we introduce, we argue that the post-2008 era represents more than just a temporary and easily absorbed disruption of international equilibriums at every level. Instead, it marks a significant structural shift in global capitalism. To navigate this new era of globalization, there's a need for a coordinated and integrative theoretical approach across political, economic, and innovative domains.

The ensuing Section 2 delivers a literature review, sketching the development of IPE across its three generational phases and delving into the idea of the new globalization during its third wave. Section 3 clarifies our method, the EST. Section 4 details our findings, outlining the specific postwar phases and their attributes. Section 5 discusses our results in relation to our research queries, culminating in our final thoughts in Section 6.

2. Literature Review

2.1. The "First Generation" of IPE (1970s)

During the 1970s, the foundational works and theoretical approaches of the "first

generation" of modern IPE emerged. This era marked the successful reintroduction of the "political problematique" into the study of economic phenomena on an international scale. Modern IPE investigates the dynamic relationship between politics and the global economy (Cohen, 2008). As Gilpin notes, this stream of research scrutinizes the interplay between the market and influential entities such as states, multinational corporations (MNCs), and international organizations (Gilpin, 2001, pp. 17–18).

Prominent figures of this "first generation," as outlined by Cohen, include Charles Kindleberger, Susan Strange, Stephen Krasner, Robert Cox, Peter Katzenstein, and Robert Gilpin (Cohen, 2008). Specifically, Kindleberger delved into the onset of financial crises, coining the "hegemonic stability" theory. Strange examined the various facets of power in international monetary systems. Krasner's focus was on hegemonic power and the shift from realism to neoliberalism. Cox critiqued the prevailing orthodoxies in international political economy. Katzenstein endeavored to deeply understand the multifaceted nature of international relations. And Gilpin's work extensively analyzed global economic dynamics.

In broad terms, the inaugural generation of IPE development appears to have established the notion that a comprehensive theoretical grasp of international equilibriums is essential. This understanding, as implicitly or explicitly indicated in their works, necessitates a holistic approach to socioeconomic events, integrating both their political and economic dimensions, and by extension, their geopolitical and developmental aspects. This foundational framework emphasized the fact that the evolution of any national or local socioeconomic formation cannot be fully comprehended without considering the international dynamics in which it is embedded and with which it actively interacts.

2.2. The "Second Generation" of IPE (1980-2008)

The period post-1980 witnessed a significant expansion of international political economy studies. These were aimed to understand the phenomenon of globalization in comprehensive terms, moving beyond a limited focus on challenges specific to the developing world.

Contrary to the traditional neoclassical view of international trade that suggests a linear evolution of the international system, globalization, when viewed from an evolutionary perspective, is a dynamic entity (Nelson et al., 2018). It is marked by numerous reversals, imbalances, asymmetries, and crises (Reinhart and Rogoff, 2014). Therefore, in addition to the foundational themes from the previous era, there was an amplified emphasis on the pivotal structural role of MNCs in the economies of underdeveloped countries and, more generally, in the operation of the international socioeconomic framework. The underlying idea was that MNCs, given their escalating prominence in the life of underdeveloped economies, extend their influence beyond just the economic aspects of the host country, and significantly sway its political arena (Delapierre et al., 2000; Magdoff, 1969; Michalet, 1976).

From this stream of research, several notable figures emerge, each with their own unique analytical perspectives and priorities. Some of the prominent second-generation researchers in this field include John Ruggie, Edward Luttwak, Francis Fukuyama, Lester Thurow, Roland Robertson, David Held, Samuel Huntington, Paul Krugman, Robert Keohane and Joseph Nye, Peter Hall and David Soskice, Charles-Albert Michalet, Emmanuel Todd, and Benjamin Cohen. The order of presentation reflects the chronology of their foundational works in this field.

Ruggie (1982) delved into the foundations of international relations with a focus on human rights advocacy. Luttwak (1990) introduced the concept of "geo-economics."

In a controversial turn, Fukuyama (1992) presented the "end of history" thesis, advocating for a global shift towards liberal democracy, paralleled by Thurow's (1992) "triadic" approach. Robertson (1992) explored the idea of "glocalization" within globalization. Held (1995) proposed a cosmopolitan perspective for the globalization era. Huntington (1996) introduced the "clash of civilizations" and the subsequent transformation of global order. Krugman (1998) analyzed emerging trade patterns and localized economic activities in his "new economic geography." Hall and Soskice (2001) presented the "varieties of capitalism" (VoC) across nations. Keohane and Nye (1998) investigated transnational relations, complex interdependence, power transitions, and the rise of soft power. Todd (2003) explored various distinct sub-structural trends in global politics. Michalet's (2005) work probed into the dynamics of global capitalism and the increasing influence of developed countries' investments in developing regions. Cohen (2008) offered an analytical classification and synthesis of the existing IPE discourse.

In this period, the IPE witnessed a surge of insightful theoretical contributions. It became evident that a comprehensive understanding of global socioeconomic phenomena requires an integrated analysis that encompasses political, macroeconomic, business, technological, and spatial dimensions of the global landscape. Concurrently, there was a significant analytical deepening in studying global "homogenization" forces and the continuous reproduction of "heterogeneity" at various levels and scales. This set the stage for approaches that bridged the macro, meso, and micro dynamics of globalization (Dopfer et al., 2004; Vlados and Chatzinikolaou, 2020). The subsequent third generation of the IPE seems to have embodied this dynamic understanding of contemporary global reality.

2.3. The "Third Generation" of IPE (2008-Present)

Amid the global changes from 2008 to the present, IPE has continued its rapid evolution and consistent analytical enrichment. A considerable cohort of scholars has probed extensively into understanding the present-day socioeconomic shifts and disturbances occurring on a global level.

A specific trend that is re-evaluating the VoC concept can be identified. Bohle and Greskovits (2012) analyze different types of capitalism in post-communist Europe, underscoring the importance of acknowledging the diverse characteristics of these systems. Detomasi (2015) delves into the role of MNCs in shaping corporate social responsibility, viewing it through the prism of multiple capitalisms. Meanwhile, Hodgson (2016) advocates for the continued use of the term "capitalism," asserting its pertinence despite its many forms. Converging studies in this area have been presented by scholars such as Dilli et al. (2018), Devinney and Hartwell (2020) Kapturkiewicz (2021), and Behringer and van Treeck (2022).

When examining notable contributors from the era, several seminal works emerge. Among these are Blinder's (2013) exploration of the financial crisis and its aftermath. O'Brien and Williams (2016) researched the evolution of global political dynamics, while Menz (2017) focused on the comparative political economy subfield. In a similar vein to Blinder, Tooze (2018) examined how financial crises reshape the global landscape, and Roger (2020) probed the origins of informality in global governance.

Additionally, the contributions of John Ikenberry, Dani Rodrik, and Daron Acemoglu are especially noteworthy. Ikenberry's seminal contributions include "After Victory: Institutions, Strategic Restraint, and the Rebuilding of Order after Major Wars" (Ikenberry, 2001), "Liberal Leviathan: The Origins, Crisis, and Transformation of the American World Order" (Ikenberry, 2011), and "The End of Liberal International

Order?" (Ikenberry, 2018). Through these writings, he develops a theory on the liberal international order, detailing how major powers, especially the United States (US), have constructed a system that encourages state cooperation and diminishes conflict.

Rodrik's (2011) significant contributions feature his theory of the "political trilemma of the global economy." This theory highlights a tension between globalization, democracy, and national sovereignty, suggesting that only two of these three elements can be maintained simultaneously. Rodrik (2007) further looked into institutional roles in economic growth, countering the idea of a one-size-fits-all institutional structure with his concept of "one economics, many recipes."

Acemoglu's most notable work, "Why Nations Fail," co-authored with Robinson, presents a theory on how inclusive institutions encourage innovation and economic growth, while extractive ones result in poverty and instability (Acemoglu and Robinson, 2012). Building on this idea in "The Narrow Corridor," Acemoglu and Robinson explore the delicate balance between the state and society. They stress the importance of both potent states and alert societies in maintaining liberty (Acemoglu and Robinson, 2020).

Thus, all examined third-generation IPE approaches stress the rising global trends, enriching the theoretical discourse with a particular emphasis on the role of institutional components in development in the context of globalization. Yet, none of these seminal works probe directly and explicitly into the subtleties of this new era of globalization. The following section aims to highlight the most pivotal approaches that have sought to clarify this matter thus far.

2.4. The Concept of the "New Globalization" in the Third Generation of IPE

Among the prominent figures in third-generation IPE, only Richard Baldwin explicitly acknowledges the emergence of a "new globalization" (Baldwin, 2016). Unlike his peers

who focus on its geopolitical implications, Baldwin primarily examines this shift through a technological lens. As such, his work is marginally classified within the traditional bounds of IPE. Specifically, he introduced and elaborated on the "unbundling" concept, underscoring the transformative shifts in global production brought about by declining trade and communication costs. In his seminal piece, "Globalisation: The Great Unbundling(s)," he described two significant waves of unbundling that reshaped trade, economic growth, and industrial locations (Baldwin, 2006). Later, he analyzed the emergence of global value chains, emphasizing their transformational impact on trade dynamics and policy challenges (Baldwin, 2011). Additionally, Baldwin's "The Great Convergence: Information Technology and the New Globalization" posited that globalization undergoes evolutionary periods of divergence and convergence, influenced heavily by technological advancements (Baldwin, 2016). Lastly, the "Globotics Upheaval" spotlighted the imminent challenges posed by digital technologies, including artificial intelligence, on labor markets and societal inequalities, advocating for strategic policy adjustments to navigate these changes (Baldwin, 2019).

Scholars in IPE have differing perspectives on the emerging new era of globalization, with various central trends and potential outcomes. Kieh (2008) views the new globalization as neo-colonial exploitation in Africa, leading to potential tensions between industrialized nations and African countries. Dasgupta and Pieterse (2009) believe this era could herald a return to Keynesian economics and see the BRICS countries (Brazil, Russia, India, China, and South Africa) as emerging hubs in various sectors. Roach (2009) suggests that due to modern technological advancements, this wave of globalization could be more transformative. Nobis (2017) underlines the multilateral aspect of this globalization, as seen in China's New Silk Road initiative, suggesting a decline in "US hegemony."

Bhattacharya et al. (2017) anticipate a fragmented global economy driven by emerging markets, but also think that political interests may overshadow shared economic goals. Killian (2021) acknowledges the advantages of digital technology but warns against its potential to exacerbate inequalities, emphasizing the need for improved governance. Vlados and Chatzinikolaou (2021b) contend that Rodrik's trilemma may be outdated in the face of the evolving dynamics of the current era. They underscore the pivotal role of BRICS nations in fostering global stability. They further argue that, as the new globalization unfolds, these countries must not only integrate themselves into the global framework but also bolster their internal democratic institutions. Simultaneously, Vlados and Chatzinikolaou (2021b) suggest that BRICS could prove capable of maintaining and adapting their national sovereignty to the changing circumstances, aiming to pave the way for a stable and sustainable global future.

In summary, there's an evolving theoretical debate about our transition to a "new globalization" era. Many contributions stress its intricate current makeup, but the specifics of this upcoming period remain undefined. This new system is anticipated to carry features from previous globalization but will be influenced by emerging socioeconomic structures, creating a "new global geometry." The precise nature and features of this era are still fluid and ambiguous. Fundamentally, a growing analytical consensus is emerging within the wider context of the modern IPE. This consensus expands the traditional political-economy analytical framework to increasingly embrace the role of technological and innovation dynamics, both organizational and institutional. This inclusion plays a pivotal role in shaping the various stages of the world system's progression. Nonetheless, as will be discussed in the following section, most current theories fall short in fully incorporating the political, economic, and technological dimensions, particularly in a co-identified and coevolutionary manner. This highlights a

significant gap in existing literature and opens up possibilities for a new analytical approach to studying global dynamics.

3. Methodology

This paper is developed through an in-depth review of literature, adopting a narrative rather than a systematic approach. It integrates various aspects of IPE literature, focusing on political, economic, and technological dimensions. The aim is to distill and integrate essential conclusions from contemporary literature, reinterpreting them into a novel framework. This framework is distinguished by its structural and evolutionary orientation, endeavoring to provide a unified and new perspective on the IPE field.

3.1. The Evolutionary Structural Triptych

We introduce the Evolutionary Structural Triptych (EST) for each period to delineate the various evolutionary stages of the global economy post-World War II. This triptych for every historical era amalgamates: A) its political structure, characterized by dominant international regimes; B) its economic structure, signified by its principal models of development and crisis; and C) its technological structure, defined by leading forms of innovation.

A) In terms of political structure, international political regimes are essentially grounded in geopolitical systems. These systems emerge and evolve through the actions of a diverse set of actors within the global framework, encompassing public, private, mixed, state, non-state, formal, and informal entities (Roger, 2020). Their primary objective is to cultivate a setting that promotes stable political consensus, regulation, and collaboration among transnational entities, as expounded by contemporary IPE (see previous sections). Such regimes manifest as a consistent socio-political hierarchy, delineating distinctions like “leaders” versus “followers,” “strong” versus “weak,” and

"central hubs" versus "peripheries." These distinctions serve to uniquely characterize specific epochs in global history, as noted by Krasner (1983), Young (1989), and Gilpin (2001).

B) As the second dimension of the evolutionary structural triptych for the "classification" of the phases of the evolution of the world system we put forward what we call the central model of development. Throughout various stages in world history, these different models of socioeconomic development have played a pivotal role, dictating the dominant set of economic structures and processes in production, distribution, consumption, saving, capital accumulation, and investment. These models, however, are not universal templates, rather they act as prominent forces setting the tone for developmental evolution in different epochs of world socioeconomic systems. Recognizing the dynamism inherent in these systems, it's apparent that specific growth-crisis models mark each historical phase, continually shaped within a unified global structure.

A valuable lens to understand this complex web of economic structures is the Regulation School or "L'École de la Régulation," a French intellectual tradition rooted in political economy that emphasizes the institutional, neo-Schumpeterian, and neo-Marxist perspectives on how economic systems behave structurally. Spearheaded by scholars like Aglietta (1979) and Boyer (1990), it delves deep into how distinct capital accumulation systems maintain stability through their historical specificities, with concepts such as the "accumulation regime" (AR) and "mode of regulation" (MR) laying the groundwork. While AR focuses on the relative economic stability arising from certain

production and distribution practices, MR captures the institutions and norms that underpin this stability.[1]

Drawing conclusions from Cotta (1991), Michalet (1976), and Orléan (2009), this approach extends to understanding global evolution. It suggests that various development-crisis paradigms have shaped the postwar international system. Furthermore, the Regulation School contributes significantly to the discourse on socioeconomic history and development. It advocates for viewing national structures as growth regimes that are susceptible to structural crises.

C) In the evolutionary examination of global history, the third dimension is the technological structure, represented by dominant innovative architecture of each era that extend beyond just technology, reflecting the multifaceted nature of innovation. According to the founders of evolutionary economics and neo-Schumpeterianism (Nelson et al., 2018, p. 3), the economy is always in motion, with change being largely driven by continuing innovation (Delapierre et al., 2000). For evolutionary economists, the most challenging and important economic questions are how economic progress came about, what can be done to enable societies that have not shared in economic progress to do better, and what kind of progress can be expected in the future, and how can we influence the paths taken. This evolutionary approach critiques the prevailing neoclassical economic paradigm by recognizing the capitalist firm as not just a static profit maximizer ("black box"), but as a "living organization" synthesizing its internal philosophies and procedures in terms of strategy, technology, and management (Chatzinikolaou and

[1] For instance, according to Lipietz (1993), the AR of Fordism is characterized by mass production of goods, proportionate distribution of value-added, and relative stability of business profitability. The MR of Fordism, on the other hand, is marked by a standardized production process, centralized decision-making, and strong labor unions that ensured a stable wage relation. Post-Fordism, conversely, is often described as a phase where flexibility, decentralization, and specialized production become prominent, reflecting a shift in both AR and MR dynamics (Boyer and Durand, 1993).

Vlados, 2019). Thus, the "evolutionary theory of the firm" proposes a historical understanding of socioeconomic systems and argues that innovation is the actual motor for growth (Freeman, 1974).

The study of innovation as the fruit of an evolutionary process of conflicts and disruptions originates primarily from the works of Schumpeter, who argued that the phenomenon is rooted in the entrepreneur's ambition of building a "private kingdom" (Schumpeter, 1939). According to Schumpeter, innovation generally means the introduction of new goods, new production methods, opening a new market, exploiting new sources of supply, or reorganizing an entire industry (Schumpeter, 1939). Thus, in Schumpeter's view, capitalism unfolds on long evolutionary waves of technological change resulting from innovation.

Building upon these theoretical origins (although not explicitly, we can identify commonalities), Rothwell (1994) presented different postwar generations of innovation, identifying the dominant model of each era. He traced postwar innovation patterns, such as the linear innovation of the 1950s and '60s, whether market-push or market-pull, the combined linear model of the '70s, the integrated approach of the '80s aligning internal and external environments, and the continuous innovation from the '90s onwards, emphasizing internal system integration and vast networks. Subsequent studies, like that of Barbieri and Álvares (2016), have expanded on Rothwell's classifications, suggesting that later generations might focus on global interactivity and innovation ecosystems. This alignment with Rothwell's paradigm showcases how technological advances, though divergent across individual systems, follow central trajectories in the broader historical canvas.

The three structural pillars—the prevailing international regimes, the dominant development-crisis models, and the main innovation trends—though interrelated in a

dialectical manner, retain their distinct analytical identities. We posit that, collectively, they capture the evolutionary essence of various world system stages. Each component, while crucial on its own, engages in a dialectical interplay with the others, guiding the course of world socioeconomic history (Figure 1).

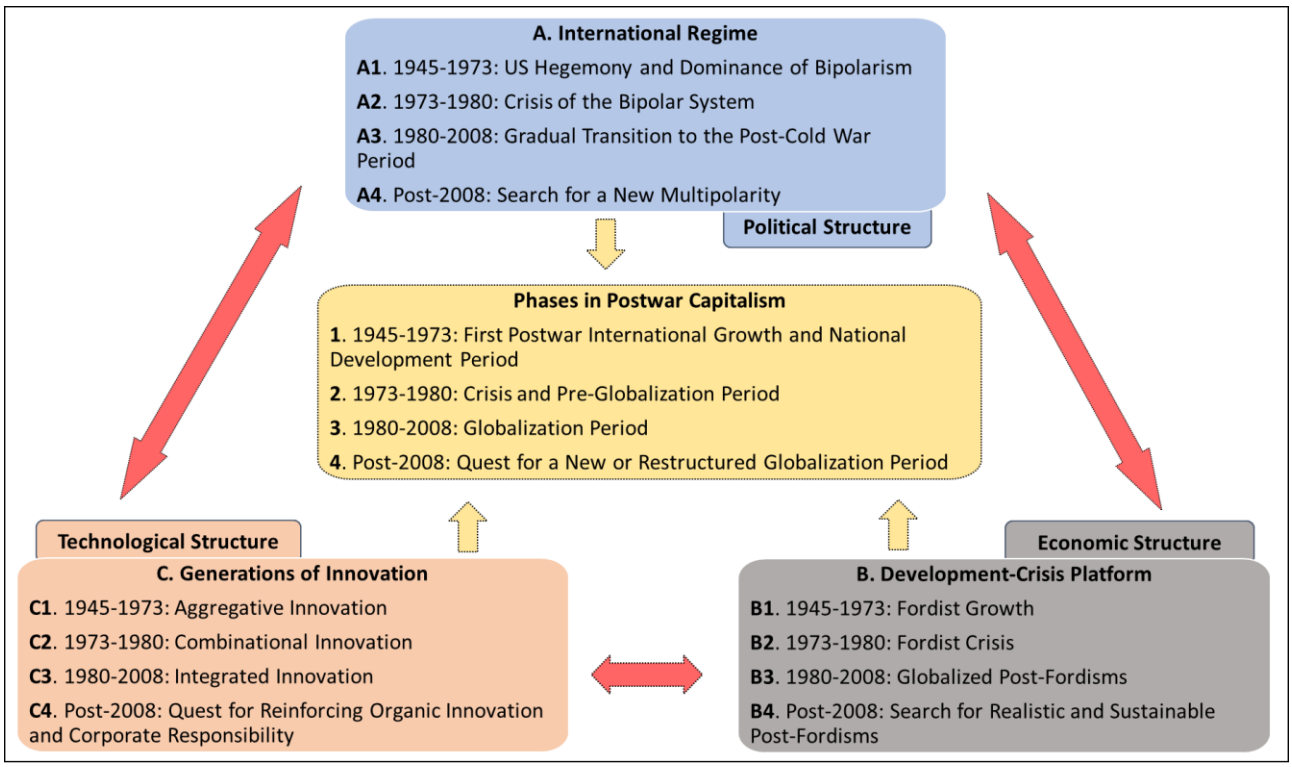

Figure 1: The postwar phases defined by the EST

The postwar era of capitalism has been marked by distinct phases: 1945-1973 was a time of international growth and nation-centric development; 1973-1980 was characterized by international crises and the preparation of globalization; the years 1980-2008 embraced the era of globalization; and post-2008 has been a period of attempting to transition to a restructured global system.

Politically, from 1945 to 1973, the US held hegemonic power in a bipolar world. This bipolar stability wavered between 1973 and 1980, leading to the post-Cold War phase that dominated from 1980 to 2008. Post-2008 has been defined by a quest for multipolarity (Roger, 2020). On the economic front, Fordist growth models were

predominant until 1973, after which globalized post-Fordisms took over until 2008 (Boyer and Durand, 1993; Lipietz, 1993). The subsequent period has been characterized by a quest for a new type of balanced growth and sustainability. In the technological realm and innovation, the world transitioned from aggregative innovations up to 1973, to combinational ones until 1980, integrated innovations until 2008, and then a shift to organic innovations emphasizing corporate responsibility (Ahmad et al., 2022; Barbieri and Álvares, 2016; Rothwell, 1994).

3.2. Transitioning from Bidimensional Frameworks to a Tridimensional Integration

The "new globalization" perspective offers a way to understand the currently evolving global order in terms of the IPE, but it is not alone. Two other influential frameworks primarily anchored in economic evolution are the "techno-economic paradigm shift" and the "Fourth Industrial Revolution." Perez (1983) presents the techno-economic paradigm shift as evolving patterns within the capitalist system, aligned with transformative technological paradigms. These shifts suggest an alignment or misalignment with global dynamics, especially when technology and socioeconomic institutions don't see eye-to-eye, as indicated by the Kondratiev long wave of development (Perez, 2010). In another vein, K. Schwab's Fourth Industrial Revolution captures a watershed moment in technology that intertwines the digital, biological, and physical realms (Schwab, 2016). Here, the integration of computational and tangible worlds signifies transformative impacts on society, governance, and our very identity.

Despite their significant interpretative value, particularly in highlighting the role of technology and innovation, the two previous approaches appear to lack a cohesive integration into the contemporary international political economy framework. They do

not seem to adequately capture the dynamics between politics and economy in today's global context (Vlados and Chatzinikolaou, 2021a).

For their part, the perspective of Strohmer et al. (2020) also offers a new view of this issue. Building upon the framework introduced by Laudicina and Peterson (2016) in the context of ATKearney's Global Business Policy Council, Strohmer et al. (2020) examine four potential trajectories for the global economy: Globalization 3.0, Polarization, Islandization, and Commonization.

Globalization 3.0 envisions a return to robust economic growth and trade reminiscent of the era before the Great Depression, coupled with increased geopolitical cohesion. Polarization foresees a world marked by economic and political rivalry, leading to a divided global economy and moderate economic growth and geopolitical cohesion. Islandization projects a future dominated by nationalism and protectionism, causing diminished global economic flows and weakened geopolitical cohesion and economic development. Conversely, Commonization paints a picture of an altruistic future driven by additive construction, the sharing economy, and millennial preferences, where geopolitical cohesion is significant, albeit not as prominent as economic growth. Yet, this perspective continues to uphold the traditional analytical divide between "economic growth" and "geopolitical cohesion," neglecting the technologically valuable aspects of the approaches we discussed earlier.

Building upon this, we propose a more refined three-dimensional model based on the EST dimensions: A) geopolitical stability, B) economic development, and C) innovation. Visualize a spectrum of outcomes across these dimensions on a global stage (Figure 2).

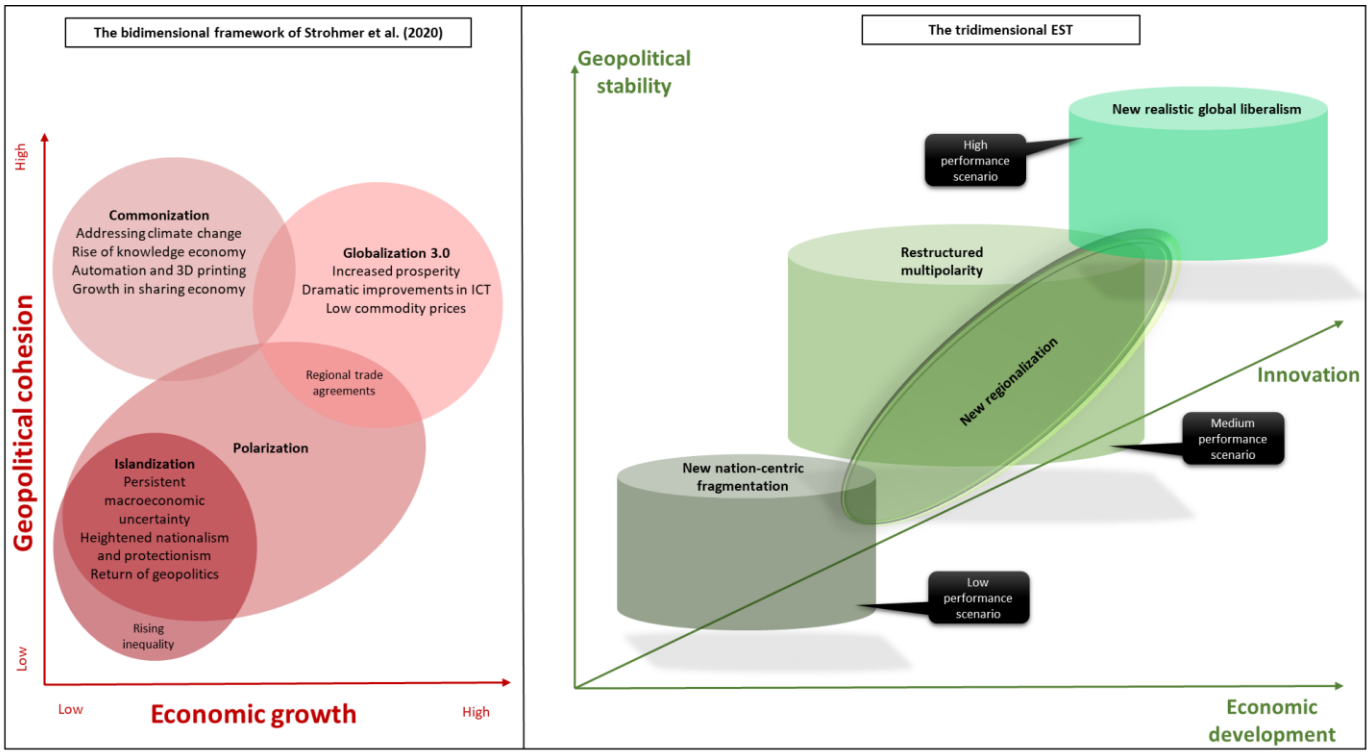

Figure 2: Elevating the bidimensional insights of Strohmer et al. (Strohmer et al., 2020) to a richer tridimensional EST perspective

Considering the new globalization phase, the outcomes can be categorized into three distinct zones: low, medium, and high. The low-performance bracket may see nations lean into a more insular mindset, reminiscent of Strohmer et al.'s (2020) islandization or past global tendencies. The medium tier predicts a multipolar world with pockets of economic, geopolitical, and innovation success, hinting at the possibility of fortified regional alliances. At the upper echelon, the high-performance vision anticipates a harmonious global stage with robust stability, thriving economic growth, and revolutionary innovations.

This three-pronged approach, grounded in EST, seems to offer a more cohesive and holistic lens to fathom the world's historical trajectory compared to frameworks like the techno-economic paradigm shift, the Fourth Industrial Revolution, or even Strohmer et al.'s (2020). The subsequent section will delve deeper into the EST methodology,

illustrating its potential for forecasting and providing richer insights into our global past and future.

4. Results

4.1. 1945-1973: First Postwar International Growth and National Development Period

The period following World War II was marked by the reconstruction and growth of national economies, with the US emerging as the dominant global power. This era was characterized by the dominance of bipolarism, as the US and USSR (Union of Soviet Socialist Republics) engaged in a rivalry for global hegemony. The international system was anchored in nationally-focused political economies, which gradually liberalized Western markets and led to increased trade flows (Ikenberry, 2011).

The Bretton Woods Agreement, signed in 1944, was at the core of the international regime of this first postwar growth period. The agreement established the International Monetary Fund, which offered loans to national governments for economic reforms, and fixed exchange rates, along with the US dollar as a reserve currency, acted as mechanisms for soft power and stability. At the geopolitical level, NATO (North Atlantic Treaty Organization) emerged as the rival to the socialist military bloc under the USSR's influence, creating a bipolar system in broad socioeconomic terms (Rodrik, 2007).

One of the hallmarks of this period was the growth of Fordism, a production and consumption model that relied on mass production and Keynesian-type public spending to stimulate aggregate demand under the expanding welfare state. Fordism was a nation-centric development model, with leading national "champion industries" playing a dominant role in consolidating each capitalism's dynamism and progress. The

international economy was mainly a hierarchical system of different national economies oriented toward internal equilibrated growth of production and demand, which was possible with more borrowing and government spending (Boyer, 1990).

In this period, innovation primarily resulted from scale economies that allowed for continuous productive expansion. Thus, innovation resulted from a linear and cumulative course of action, as large enterprises invested in internal research and development mechanisms, and more invested capital meant increased scale and profitability. Therefore, productivity was the critical measure that determined the growth prospects of a nationally oriented firm, and consequently, national economic growth (Rothwell, 1994; Vlados, 2019a).

Taken together, US hegemony and the maintenance of a balanced international order, the spread of Fordism in different national economies, and aggregative innovation as a growth mechanism led to a relatively stable world economy. These three dimensions were interconnected, forming a dynamically balanced international socioeconomic system characterized by rapid and relatively "unhindered" capitalist growth and development. In essence, each aspect of this structural triangle complementarily evolved, contributing to an increasingly improving global equilibrium.

4.2. 1973-1980: Crisis and Pre-Globalization Period

The period between 1973 and 1980 was marked by a series of crises that destabilized the international system and set the stage for the emergence of a new era of world capitalism. The oil crises of 1973 and 1979 were major turning points, leading to stagflation and persistent inflationary pressures, which led to a slowdown in investment, reduced profitability, and economic growth. The crisis of the bipolar system was further exacerbated by the Nixon administration's decision to lift the dollar's convertibility to

gold in 1971, destabilizing the US hegemony and leading to a new framework (Gilpin, 2001).

The crisis of Fordism was also a defining feature of this period. The prevailing capitalist development model of mass production and rapidly increasing consumption entered a multifaceted stagflation crisis, with most industries experiencing a slowdown in productivity growth. This crisis marked the transition to a new era as different national economic recessions began to take on a universal character with similar solutions: the international orientation of oligopolistic companies as the domestic market could not cover their needs. The customer was now better informed and educated, seeking specificities not previously offered by national industries (Boyer and Durand, 1993; Lipietz, 1993).

During this time, large enterprises in the developed capitalist world began to redefine their innovation dynamics, increasingly focusing on marketing practices that could connect their products to specific market needs. Innovation primarily resulted from multiple linkages between all business operations, paving the way for exploring the economies of scope that grew in the globalization that followed (Rothwell, 1994; Vlados, 2019a).

Overall, the structural and profound turmoil during this period destabilized the international system, which gradually ceased to be the one-dimensional sum of national enterprises and bipolar geopolitical forces. The crisis of Fordism marked the transition to a new era, as reinforced marketing strategies played a significant role in large firms' aim for solid differentiation and delivery of high quality to specific market segments.

The progressive multinationalization of firms and the initial expansion of foreign direct investment began to fundamentally transform world capitalism during this transitional period (Michalet, 2005). The destabilization of bipolarism, the crisis of

Fordism, and the innovative strategic refocusing of firms collectively reshaped the entire foundation of international capitalism. As a result, different national socioeconomic spaces gradually moved towards a path of structural integration, encompassing production, consumption, and broader socioeconomic dimensions (Robertson, 1992). In this context, the three structural dimensions of the world system—politics, economy, and technology—experienced a period of crisis, saturation, and instability, while also undergoing simultaneous dislocation at all three interdependent levels. This dynamic led to the emergence of the globalized phase of the world economy, with the crisis serving as an incubator for this subsequent transformation.

4.3. 1980-2008: Globalization Period

The period from 1980 to 2008 was marked by significant developments, including the emergence of new economic superpowers and a shift towards global governance via informal policy organizations. This era also witnessed the evolution from Fordism to an era referred to by scholars as "post-Fordisms," indicating a variety of approaches and strategies beyond traditional Fordist principles. A pivotal geopolitical event in this period was the collapse of the Soviet Union in 1989. This was followed by the rapid rise of the BRICS nations in the early 2000s, who established their economic power by developing frameworks that operated outside the purview of established Western international organizations (Vlados and Chatzinikolaou, 2021b).

Throughout the globalization era, global governance primarily resulted from fluid decisions made in informal policy organizations, such as the G7, among the world's dominant economies. The "Washington Consensus" advocated for the transfer of liberal institutions to the poorest economies as their fundamental direction of progress, which proved to be a central pillar of the globalized system (Roger, 2020).

Post-Fordism, as it manifested in various forms globally, was a system of sophisticated production and consumption primarily in developed capitalist states. The distinguishing feature of this development-crisis model was the enhanced economies of scope, where specialization and customer specificity played a leading role in product strategy. Different capitalist variants emerged in this era, whose development prospects depended on the firm-industrial competitiveness they could host and their attractiveness for attracting investment (Boyer and Durand, 1993; Lipietz, 1993).

In this era, competition became faster and more disruptive than in the past, forcing businesses to explore new innovation strategies. The globalization of industries required increasingly flexible methods, with firms emphasizing excellence to reinforce competitiveness and gain market share over competitors. With globalization, a close cooperative relationship with key customers and integration with suppliers became critical strategic choices, leading to a move toward a fifth-generation innovation and system integration and networking process (Rothwell, 1994; Vlados, 2019a).

In summary, the globalization period was characterized by the emergence of new economic superpowers, the shift to global governance through informal policy organizations, and the transition of Fordism to post-Fordism. The different globalized post-Fordisms of the Center and Periphery contributed to relatively stable development at the global level. The explosive rise in business innovation primarily benefited the customer, significantly increasing worldwide living standards. However, the examined structural triptych demonstrated a capacity to rebalance itself, paving the way for a mutually reinforcing evolution of all three dimensions.

Nonetheless, the global crisis of 2008 signaled a significant turning point, ushering in an era of profound restructuring. The volatility of international financial

markets led to adjustments and disruptions, causing multiple regional crises and culminating in the global crisis of 2008 (Blinder, 2013; Orléan, 2009).

4.4. Post-2008: New or Restructured Globalization Period

From our examination of the postwar phases of global capitalism and drawing from insights in Figure 2, we elevate Strohmer et al.'s (2020) bidimensional analysis into a more intricate tridimensional EST paradigm. This results in identifying three anticipated performance tiers for the next globalization phase: low, medium, and high. Each tier reflects a potential scenario that could emerge in the near future. These scenarios depend on how well the three structural spheres of the global system rebalance and mutually reinforce each other.

In the most constrained zone, the new globalization might lean towards a nation-focused fragmentation. This would be characterized by a dominance of national, inward-looking views related to geopolitics, development, and innovation. Such a trend resonates with Strohmer et al.'s (2020) concept of "islandization", potentially paving the way for a resurgence of protectionism, national cultural autarky, and political shifts towards populist and authoritarian governance. This could be reminiscent of international regulation methods from the interwar period (Cornell et al., 2020).

Moving from this polarized low-performance zone, a wide spectrum of developments emerges, termed as the medium-performance zone. This zone could witness the rise of a restructured multipolarism, where all potential outcomes entail medium-scale achievements in geopolitical stability, development, and innovation. The less favorable scenario here sees failed attempts to move beyond a narrow nation-centric view, with the absence of integrated socioeconomic poles. Conversely, the more optimistic view (medium-to-upside) suggests enhanced regional dynamics leading to

relative geopolitical stability globally, cohesive socioeconomic development, and sufficient progress out of innovation.

This era's trajectory is likely to be heavily influenced by a new form of regionalization, distinct from post-Cold War concepts, focusing on heightened inter-regional collaborations driving economic progress (Wang, 2020). Contrary to reverting to past imperial or bipolar divides, this restructured form of regional integration represents a continuation of previous globalization influences in globalization (Marinova, 2020).

These evolving regional partnerships could result in varied geopolitical and geoeconomic formations, aligning with the high-performance scenario labeled "new realistic global liberalism." Grounded in acknowledging the world's growing diversity, it could reject oversimplified views of a completely homogenized future (Kellner, 2002). This scenario aligns with Strohmer et al.'s (2020) Globalization 3.0, characterized by:

A) High Geopolitical Stability: Aiming for a balanced multipolarity, promoting geopolitical realism, bolstering international institutions that accentuate security, tolerance, and agile decision-making. This could fortify democracy via refocused geostrategic cooperation among Western allies, deepen European unity, and advocate sanctions against destabilizing entities (Faudot and Rossiaud, 2022; Grekou et al., 2022).

B) High-Performance Development: Steering towards sustainable growth while addressing climate challenges, prioritizing eco-friendly production and consumption patterns (Zehr, 2015). Diverse socioeconomic entities might prioritize entrepreneurial structures, focusing on resilience, adaptability, sustainable development, and inclusivity (World Economic Forum, 2018). This is envisioned as variations of "sustainable post-Fordisms."

C) High-Performance Innovation: Companies might further adopt organic strategies reminiscent of biological entities rather than rigid machines (Burns and Stalker, 2011). Organic combinations of organizational strategy, technology, and management could increasingly lead to innovational progress within firms (Välikangas and Merlyn, 2002; Vlados, 2019b). Moreover, a broader corporate responsibility vision could emerge, intertwining profit motives with the creation of social value (Ashraf et al., 2021; Cukier, 2019).

Finally, a pivotal element of the EST that warrants mention is the interdependency among the spheres it integrates. In scenarios of geopolitical instability paired with low economic growth, there could be no adequate resources and profitability prospects to fuel robust innovative advancement. Such weak economic growth, combined with an insufficient push for innovation, can politically destabilize any given socioeconomic system. As a result, these systems could grapple with poverty and lag in technological progress. It's challenging in such scenarios for one of the three dimensions to surge ahead while the other two fall behind, given their intertwined nature. This interrelation is also evident in scenarios with moderate or high achievements. For instance, achieving high-performance benchmarks necessitates harmonizing high geopolitical stability with a new multipolarity, which might foster sustainable economic growth rooted in organic innovations. It's noteworthy that while this mutual dependency is evident in Strohmer et al.'s (2020) approach, it isn't explicitly stated. Strohmer et al. (2020) don't overtly attribute the performance zones they outline to the interplay between the two key dimensions they analyze: geopolitical cohesion and economic growth.

5. Discussion

The current study suggested the progressive emergence of a newly restructured form of

globalization. Utilizing the three-dimensional EST, and contrasting it with the bidimensional framework proposed by Strohmer et al. (2020), it chronicled postwar global capitalism and concluded that a new wave of globalization appears to be on the horizon. Subsequent sections delve into the foundational reasons for this emergence (5.1), the anticipated future trajectories and their justifications (5.2), and the varied interpretations and their respective theoretical categorizations (5.3).

5.1. First RQ Insights: Unpacking the New Globalization Post-2008

In our analysis of the modern IPE, particularly when examining works that focus on the emerging new globalization, a clear consensus emerges: this trend is mainly driven by factors rooted before 2000 and became significantly evident after the 2000s. These dynamics arose due to the saturation and subsequent destabilization of the structures from the first phase of globalization (1980-2008). Scholars who approach this topic from an evolutionary perspective, such as Perez (2010), Schwab (2016), Baldwin (2016), Vlados (2019a), and Strohmer et al. (2020), have either directly or indirectly underscored this point. Drawing from the framework of the EST, we confirm that this emerging new globalization represents the outcome of previous structural developments. Utilizing Vlados's (2019a) terminology, this can be understood as a "structural maturation" of antecedent conditions, rather than a transient crisis assimilable to the previous system.

Specifically, evidence revealed significant transitions in the postwar global capitalist landscape. This landscape evolved through phases: initially, nation-centered development-growth and bipolar rivalry dominated (1945-1973), followed by a period of crisis and pre-globalization adjustments (1973-1980). Subsequently, the expansive phase of globalization (1980-2008) emerged, marked by economic superpowers and a transition from Fordism to a variety of national post-Fordisms (Boyer and Durand, 1993; Lipietz,

1993). It's essential to note that specific years, such as 1945, 1973, 1980, and 2008, are conventionally used to symbolize pivotal moments in historical transitions, serving as temporal landmarks in an ongoing process of change. The evolution of the world system isn't linear; it encompasses foundational shifts, developmental strides, adjustments, maturation, and periods of decline, transitioning from one phase to another. With 2008 as a reference point, this study suggests that the era following 2008 marks a quest for of a "new globalization" or a "restructured globalization." This era is characterized by novel and even more complex socioeconomic developments than those of the past.

In essence, addressing the first RQ, the rationale behind the rise of the new globalization post-2008 can be distilled into three primary insights. First, the financial turmoil of 2008 was not just an isolated crisis; it marked a significant tipping point in the broader evolutionary trajectory of global capitalism and the rapid rise of new economic powers on the global stage. Second, this evolutionary trajectory involves repeated phases of growth, adjustments, maturation, and decline, as observed in the periods leading up to 2008. Third, the post-2008 landscape, shaped by both its inherited historical contingencies and new economic, political, and technological dynamics, has ushered in a process culminating in what might aptly be termed "restructured globalization." Far from being a mere revival of the pre-2008 equilibrium, this emerging form of globalization represents a global ecosystem that is significantly more intricate, interconnected, sensitive, volatile, and diverse. This transformation is marked by the emergence of new dynamics. It is imperative to understand this new geometry of the global ecosystem, as it is essential not only for comprehending the past and present but also for anticipating and navigating the increasingly complex and combinatorially evolving challenges and opportunities of the future.

5.2. Second RQ Insights: Navigating Future Prospects in the New Globalization Era

In today's world, we face an array of unique challenges: pressing issues from climate change and global warming (Bradford, 2018) to geopolitical disruptions such as the Russia-Ukraine conflict (Faudot and Rossiaud, 2022; Grekou et al., 2022). Add to this the impacts of the COVID-19 pandemic, rapid technological changes that widen digital disparities (Calderón-Gómez et al., 2020), and an urgent global migration crisis (Bhabha, 2018). These shifts compel us to ask: how do we comprehend these transformations, and how can we sculpt a sustainable future?

While predicting the trajectory of the emerging globalization with certainty remains a daunting task, insights from the EST suggest potential scenarios rooted in "low-medium-high" performance zones:

1. Low-Performance Zone ("New Nation-Centric Fragmentation"): In this scenario, nations become protectionist and inward-focused, leading to slow economic growth, innovational fragmentation, and isolation. The governance style is populist, similar to the interwar period.
2. Medium-Performance Zone ("Restructured Multipolarism"): This scenario combines some nation-centric views with stronger regional alliances to achieve global balance. Efforts include sporadic but coordinated economic revitalization and innovative cooperation, fostering emerging regionalization forms.
3. High-Performance Zone ("New Realistic Global Liberalism"): Based on Strohmer et al.'s (2020) Globalization 3.0 concept, this optimistic vision embraces global diversity, geopolitical balance, sustainable growth, and innovation within open, collaborative systems. This concept is

fundamentally built on resilience, adaptability, and the incorporation of responsibility into socioeconomic values.

It's unlikely for extremes of high and low performance to be isolated within a single area. For instance, thriving economics coupled with swift innovation requires geopolitical alignment. On the other hand, in a declining economic backdrop amidst geopolitical strife, fostering innovation is an uphill battle.

Evaluating Strohmer et al.'s (2020) "commonization scenario" through the EST reveals its challenges. With pressing concerns like adapting to climate change, propelling the knowledge economy, and harnessing fourth industrial revolution tools in a low-growth setting, this vision seems less feasible.

In conclusion, as we ponder the future, it becomes evident that simultaneous development in geopolitical, economic, and innovative domains is essential. The new globalization could lead to high performance through the integration and promotion of the following developments:

- Geopolitical Sphere: Embracing a democratic multipolarity, with respect for both major Western players and emerging nations, countering extremist ideologies and focusing on cooperative global leadership.
- Economic Sphere: Pivoting towards a more responsible and realistic capitalism rooted in sustainability, focusing on long-term environmental balance and minimizing the risks of financial volatility and short-term speculation.
- Technological Sphere: Embracing an innovation paradigm that is closely linked with corporate responsibility, this strand is about the promotion of open and unhindered technological collaboration. It emphasizes the importance of respecting contemporary ethical standards, acknowledges

the productive nature of global ecosystem interconnectedness, and emphasizes the growing importance of distributed innovative systems across various sectors.

To address the second RQ succinctly, the way forward in the new globalization landscape is predicated on a harmonious equilibrium across geopolitical, economic, and innovative domains. Our collective understanding and readiness to adapt will shape the future. In the face of myriad challenges, the new globalization era could offer the potential to craft a sustainable and inclusive global community. Drawing from the EST and insights from Strohmer et al. and others, we stress the importance of bridging divides, fostering collaboration, and promoting responsible innovation as central to building a resilient and prosperous future.

Fostering collaboration in a world marked by conflicts and diverse perspectives is a significant challenge. To address this, prioritizing global forums and diplomatic channels could be beneficial. These channels should be designed to foster dialogue and understanding across different political systems, ranging from liberal democracies to autocracies. Additionally, utilizing international organizations and agreements to establish common ground for cooperation is crucial. Focusing on shared challenges, such as climate change, may offer a starting point for wider collaboration. The global responses to recent crises, like the COVID-19 pandemic and climate change, offer valuable lessons about the potential for global cooperation in a new, necessary spirit.

However, it's important to recognize that creating a better global future is unrealistic under conditions of weakening and decay in any of the three interconnected and co-evolving spheres identified in the EST approach. These spheres encompass political, economic, and innovative dimensions. For global responsibility initiatives to be effective, they must incorporate a coherent, holistic, evolutionary, and structural

understanding of both the problems and possible solutions, considering political, economic, and innovative aspects simultaneously.

5.3. Third RQ Insights: Diverse Theoretical Lens on the New Globalization

The modern discourse on the "new globalization" within the context of IPE must underline the significance of a multi-faceted approach, focusing on politics, economic growth, and technological achievements. In most approaches examining the emergence of a new global system today, such as those of Schwab (2016), Perez (2010) or Strohmer et al. (2020), the emphasis is primarily on economic-technical or politico-economic dimensions. Moreover, in the thorough analysis by Baldwin (2016), who specifically studied the new globalization, the emphasis is primarily on technological dimensions.

While these examinations are undeniably in-depth, they employ varied theoretical instruments, often stopping short of providing a unified perception model to conclusively address the emergence of new globalization. However, when viewed through the lens of VoC (Detomasi, 2015), there seems to be a convergence with the EST, as it pays particular attention to institutional facets that simultaneously span politics, economy, and technology-innovation. Acemoglu's institutional-historical perspective further enriches this discourse (Acemoglu and Robinson, 2012).

The prevalent trend within IPE has been primarily to understand global realities in a dual dimension: juxtaposing geopolitical stability with economic growth. Our exploration introduces a pivotal third dimension: the realm of technology and innovation. By bridging Schumpeterian thought and evolutionary economics, the EST offers a comprehensive approach to IPE. It emphasizes that innovation transcends mere technological advancement, encompassing strategic positioning and management with increasing significance (Chatzinikolaou and Vlados, 2019; Nelson et al., 2018). Such a

viewpoint aligns with generational innovation models like Rothwell's (1994), but doesn't overlook the broader political and economic contexts. Consequently, the EST could also enhance contemporary organizational and operational micro-analyses by blending innovation, economic growth, and politics within strategic and managerial business frameworks, steering them towards an evolutionary direction.

In the realm of policy-making, it's increasingly vital to adopt an integrative and holistic approach, especially concerning technology and innovation within our political and economic diagnoses and interventions. This shift in perspective broadens the scope of IPE. It acknowledges that IPE isn't just about the diptych of geopolitics and economic growth. Rather, it also includes the rapid advancements in innovation, which arguably have an equally significant, if not greater, influence at all levels.

Essentially, in response to the third RQ, various theoretical approaches to the new globalization often remain compartmentalized, either focusing on economic-technical, politico-economic, or purely technological dimensions. However, we think that an integrative approach, such as the EST, presents a more unified perspective that simultaneously spans politics, economy, and technology-innovation. While the interdisciplinary discourse on new globalization is vast and continues to evolve, it's evident that a synthesized perspective that merges geopolitical stability, economic growth, and innovation dynamics offers a more comprehensive analytical framework. This framework not only bridges theoretical gaps but also provides actionable insights for policymakers and businesses alike.

6. Conclusion

In this research, we have embarked on a comprehensive investigation of the mutations taking place in global capitalism, illuminating the dawn of the new globalization era.

Utilizing the EST analytical framework, we explored an integrated perspective that weaves together the complexities of politics, economics, and technology-innovation in their dialectical coevolution. Here are the principal insights distilled from our exploration:

- The restructured globalization that appears to be emerging represents an attempt to strike a new balance in the contemporary world system. Yet, this equilibrium cannot be realized within the previous system's architecture; it necessitates a range of adjustments across all levels concurrently.

- In terms of future prospects, the new globalization era demand a reharmonized balance spanning geopolitical, economic, and innovative developments worldwide. With challenges ranging from climate change to geopolitical disruptions, it's imperative to embrace cooperative global leadership. This involves fostering a form of capitalism that prioritizes sustainability, adaptability, resilience, and inclusivity. Moreover, the transition toward open and organic innovation models seems, deeply rooted in modern ethical considerations, seem imperative in order to pave the way for the construction of a new global architecture.

- Existing theoretical frameworks often compartmentalize the facets of the new globalization, resulting in diminished interpretative and explanatory effectiveness. Yet, the EST introduces and advocates for a holistic perspective that dialectically integrates politics, economics, and technology within the context of modern global trends. By offering such an integrative view, the EST not only bridges theoretical divides but also affords actionable insights for an inclusive and dynamic global future.

While our research presents some intriguing conclusions, it also has its limitations. Our primary focus was on the postwar global economy, yet it appears that the EST framework possesses sufficient versatility for broader applications. Its application across various historical periods and geopolitical contexts could shed further light on the complex interplay of politics, economics, and technology, revealing their collective impact on the global socioeconomic system across various timeframes and regions (Vlados, 2024). Additionally, the EST's comprehensive nature indicates its potential in forming a composite indicator. This would involve amalgamating various metrics to assess global progress in areas like geopolitical stability, economic development, and innovation. For instance, the "geopolitical stability" aspect could include factors such as political stability and rule of law, while the "development" category might integrate metrics similar to the Human Development Index. For "innovation," the Global Innovation Index, with its focus on science investment and technological progress, could be appropriate.

Further interdisciplinary research, incorporating perspectives from international sociology and environmental science, could enhance our understanding of the complexities inherent in global capitalism and its evolution into a new era of globalization. The focus on policy implications, particularly in sustainable and inclusive capitalism, presents new research opportunities. These could explore how global leadership and policy might adapt to current challenges. Additionally, applying the EST framework to distinct historical periods could yield further evidence, while examining the ethical dimensions of modern innovation models may address critical issues in the evolving landscape of global technology and innovation. Ultimately, we believe that this comprehensive and integrative approach not only bridges theoretical gaps in analyzing the history of the world system but also establishes a foundation for actionable insights, fostering a dynamic and inclusive global future.
